

CHAPTER – 31

TERMINOLOGY OF QUALITY IN DEVELOPMENTAL FRONTS OF GOVERNANCE

Quality is an important parameter for a customer while purchasing a commodity. Also government workouts are in clause as for the benefit to the nation but then also we need to measure the potentiality of the government procedures for this quality plays an important role. The government procedures need to be scrutinized in the background of their viability to serve the populations for this we will set a threshold in quality terms as up to what extent the procedures of development can be certified in the governance domain. The quality terms are thus dictated for in market terminology and in the manifestations of the government workouts to categorize the process as fruitful to the population or not.

Quality in market terminology can be explained as the value thus cost of a commodity along with efficient life is better from previous cycles of its manifestations. The explanation is thus to be traced as present manifestation of the product is high yielding in terms of its utility and also serving the economic folds by providing efficient life thus saving the cost of utilization by being virtuous in value. This means good quality products are non-exhaustive and long lasting thereby proving to be cost effective. Quality should always be kept at stake while producing a product. Only cost effective and long lasting good quality products must be brought into the market such that there is definite saving of money. The explanation is thus to be traced into the virtuous folds of the product to prevailing circumstances thus yielding to be cost effective. The virtues which are yet to be adopted arising out of modernization footholds also play a dominant role while judging the potentiality of the product to serve in improved environments.

Quality in government workouts is to be explained as quality is that threshold which inherits a manifesting value such that this value will provide more readiness to prospects of work. Quality is thus to be measured in terms of the manifesting value such that it will improve the overall efficiency of the system and good returns will be gained in the end. The quantitative terms of the manifesting value is the extent up to which it will serve the needs of the public. The cost incurred in the process and returns thereof from the process will be the manifesting value of the workout. The cost analysis is essential to bring out the manifesting value of the workout. The process would be classed as of high quality if it returns the cost of the project in good spirit with minimum upheavals in the social sector. The right manifestation of the workout is to be maneuvered by allocating resources within the available range of resources and extension of workouts in the government domain. This step will ensure safety of funds and will ensure uniform growth in all circles. Thus quality is classed as average, good or excellent by the amount of returns it will provide in direct steps of its execution.

Quality realization is essential in government domain such that we keep the interest of the nation in sound perspectives and also at the same time hold full accountability to the public as to the processes of development in the country. In market manifestations quality values the product highly such that it leads in competition and duplicate products of same types emerge in the market if quality has duly satisfied the norm of the work culture. Quality values the product highly such that its sale in the market is in volumes and the system is highly profitable for all range of populations. In market

terminology product is valued and priced only on the past performance of the product such that we gain in monetary terms.

A developmental model is suggested out of the quality system which can be briefed upon suitably. There are few primary requirements from any kind of developmental model. The developmental model should alleviate poverty, developmental model should provide employment opportunities to the public and developmental model should bring about transformation in the business modalities of the people to cater to necessary uprisings in the developmental forefronts of livings. Let us consider the first paradigm. The prospects of quality are such that there is active pace of development and competition is high among the products such that only good quality products survive in the market which as such means that prices are kept under check up to a much greater extent which results in savings on various accounts. Thus when quality is kept at stake then not only the manufacturer benefits out of a large system of sales but public also benefits from the processes while high amount of revenue is generated in all hands. The dynamic terminology of quality in technical terms improves the performances of the populations greatly and enhances trade which benefits the monetary powers. The savings in the monetary aspects can be utilized for policies which alleviate poverty thus the quality terms has benefitted the poverty alleviation needs of the poor people. Let us consider the second paradigm. The quality thresholds in development require skilled labor to suffice the cause of the products towards their service and hence forth ample employment opportunities would be generated if quality prospects are kept at stake. The perpetual effect in employments would extend from high class employment to low class of employment if quality is kept at stake in all domains of the work culture. The extent up to which quality levels are prescribed for the populations will dictate terms for the employment levels. The second paradigm of development is also sufficiently catered by the quality term in development. Let us consider the third paradigm. The truth of the demographic data of the populations plays a major role in development. When there is quality in development then various thresholds and parameters of the channels of developmental grounds are clearly evident hence we can act accordingly to suffice the cause of progress with growth which as such brings about transformation in the life of the public. When there is quality in development then the extension of growth procedures extends to long range of times which is fruitful in business transformation. Thus third paradigm is also sufficiently catered by the quality term in the developmental model of the country.

Quality is a transformational attribute which can serve the mankind to the extent the deliberations are fabricated for the benefits to the populations. If the quality term has transformational features to wide ranges and extent such as change from analog processes to digital processes then it is imperative the extension of development can be carried over to long periods of time and to wide extent in vast domains of work culture. The transformational features as attributed by the computer technology has the potential to change the face of entire generations and thus the quality terminology if analyzed in the background of computer terminology has the potential to dictate explicit order of trades for all range of populations to their benefits and liking.

A developmental model suggested out of quality system is briefed upon suitably. When quality is kept at stake then there is active pace of development as competition is high. Competition among products leads to improved efficiency of the overall business scenario. The prospects of quality system introduced into the business streams leads to duplicate products emerging in the market. Thus the quality system has benefitted all class of people which without quality system could

not have been achieved. An effort should be directed into the developmental model to keep quality at stake so as to fulfill the dreams of all of the populations. Good quality products will be part of the rich class of people and semi-good quality products will be part of general masses of the country.

While looking into the developmental model suggested out of the quality system a look at the pricing system of the commodities is mandatory. While increasing the price of the commodity it is essential that monetary benefits are in clause with improved quality of the product. The improvement in quality should fetch improved prices otherwise the price should be held stationary. By adhering to this principle that price would improve upon only when the quality of the product is improved upon all range of products can be monitored for price check. The entire gamut of products should be monitored for price check by installing price control centers such that we suffice the cause of the price rise. The process of pricing the commodity by this principle would instill a dose of confidence in the public and moreover there are various advantages of this pricing strategy. The product would be a sample of attraction for all of the populations for long periods of time as price check is instilled by this policy and hence will improve the sale of the product. As the product remains on the market horizon for long duration of times we can see the savings of the public managing the course of purchases of commodities. Therefore the product can do justice to all manners of public by these exposures such that political system will gain in dimension from this policy. Pricing system based on quality would lead to various parameters of developmental model showing upward transition. Poverty alleviation can be taken into strong footholds as sale of the product would improve next employment levels will be generous and transformation in social life of the public would be an easy process.

By introducing quality into the developmental model technology barriers would be broken such that we will in clause see technology gaining in strength at home. This would improve employment opportunities in the country and instill a mark of confidence into the developmental policies of the country. When technology barriers are broken then people can take a sigh of relief by mass satisfaction to the people both on living folds and into the monetary power of the masses. It is the technical deliberations which are essential component of all developmental workouts thus when technology is produced at home it can be casted into work culture easily and will associate various advantages to the public. The monetary savings will increase out of the efficient use of the technology if the technology is produced at home.

The terminology of quality system can be shaped only when there is ample monetary resources and ample manpower to handle quality terms of development. The quality system needs constant inputs and expertise to guide the course of its processes such that we need to keep all of these quantities in ample amounts. The process of quality system is transformational for a transitory period only as the process when becomes part of the masses then it loses its grits and then all of its processes are easily comprehending which makes for reduced dominance in channeling the course of quality perspectives. The quality system is for the benefits to the rich who can contribute to the developmental model and can enhance the performances of the populations.

Quality improvement techniques can be taken to such footholds that exports can be thought of from the country. Increased exports of the country will bring foreign exchange to the country and balance of payments will improve. Quality improvement techniques are to be inherited from other

countries and presenting this our own original outlook will lead to spread of home culture in other countries.

Quality in technical terminology should prove itself to be cost effective in long range of times. The quality sources in the development of technical domain should maintain standards which constantly review the cost effectiveness by building safe modules and moreover to incorporate the cost effectiveness of the product at each stage. Technical products are costly and optimizing the performance of these modules will be a great achievement for the developmental scenario.

Quality is to be understood as that mode of expressive workouts which signifies efficient work culture. The icon is to be interpreted as that value which enhances the overall efficiency of the workouts and lays a threshold which can be demarcated as a venue which will bring in economic solace to the populations. The process cannot be associated as an abrupt change in policies of workouts but has to yield to terms which can be managed in totality thus are capable to channel the work culture as well as satisfies the demands of the public. The process of workouts should be fully commendable while deliberations in the public should be associated as real postures which can be delivered by the people. The exaggerated channels which put lot of pressures on resources and are least manageable to individual workouts cannot be termed as quality thresholds. The meaning and purposes of iconic quality is thus to be traced into serving the populations with full efficiency and providing recourses of economic salvation to the populations. The mandarins of quality channels should interpret the channel of work culture and should analyze the efficiency of work culture in new scenario in feasible terms before taking recourse to implementation.
