

CHAPTER – 27

INDUSTRIAL PROCESSES IN THE COUNTRY

Industrial processes should guide the natural instinct of the mankind. The nature of the industrial process should be virtuous in open folds. The establishment should be profoundly attributed for locating the needs amidst public such that prospects are achievable in desired forms and process in itself yields to the aspirations of the public. By these formulations the industrial process can grant us virtues adaptable to the needs and process in itself will thus yield to in smooth sailing perspective. The needs in the public should be attributed to not only the upper class but to the lower class of people as well which as such will help in industrial processes getting certified in all domains. The industrial process should not be a cause of creating division in the societies but should be high yielding such that we can manifest the process on true lines of welfare norms for benefits to the populations. If the purpose of industrial processes is located in industrialization then the natural instinct of the mankind should guide the forefronts of industrialization as universal acceptance by all of the people. The industrial processes would then pave way for mutual understanding among the public and maintain the constitutional order to the highest degree.

Industrial processes should be virtuous to the extent that they generate revenue in direct measures to the initiatives to industrial processes and thus lead to satisfying the norm of benefits for all class of people by being virtuous in various formats for the public. On these lines the rich class will reap the benefits in the form of industrial products and services while the poor class will hold the sanctity of industrial process as it would get grants from the industrial process in the form of taxes. The industrial process is acceptable to the public only when the process in itself can generate stability in society and at the same time fulfills the aspirations of the public. The acceptable norm of the industrial process is essential because then we can think of long range benefits from the industrial process. The industrial process is not in clause as spending recklessly for establishing its manifestations among the public but has to fulfill the order as of acceptability with benefits in the public forefronts as a continuous measure. The industrial process should not destabilize the perspective of inclusive growth thus should be virtuous in open folds which can grant the process freedoms of various kinds.

Industrial process should be subjected to various testimonies before it can make its existence in the public. The testimony should be taken into account not only in the governance domain but should include various factors which are essential for easy implementations and channeling the course of industrial process. The testimony should be undertaken in social domain as to the acceptance of the owner of the industrial process. The testimony should be undertaken if the industrial process will yield to easy maintenance of the technological perspectives of the industrial process and if the owner is virtuous enough to guide the forefronts of technology by oneself or with a team of professionals. The judicious approach for establishment which is in clause with monetary folds should be undertaken as to if the industrial process is accountable to the governance domain or not. Last but not the least is the clause if the industrial process can maintain the sanctity of the process in long run and can be virtuous to be profitable enough to garner the change in the form of livings of the people.

The domain of governance has to certify the industrial process by manipulating the establishment as virtuous or not. The governance of modern times has all of its manifestation in scientific terminology thus it is essential the industrial process comes true on the scientific terms. The terminology of scientific term is essential because then judicious approach becomes the norm of development. The usage of scientific terminology extends its effect such that it grows the menace of establishment of industrial processes which are scientifically tested thus are viable to the public in long terms and on the virtues of quality outfits to the manifestations. Good quality products are non exhaustive in nature as they are long lasting.

The directional norms for the industrial process should always be on the anvil of the government managers who can do justice to the public and to the outfit by locating the virtues as suited to the public. The government procedures are always of support to the industrial processes but still they need to be managed for gains to the entire nation as a whole. The outfit needs to be taxed at various stages and also needs to be managed for easy recourse to public folds. The attributes in governance are to be located in making the industrial outfit as successful venture for the public and seek the manifestations of the industrial outfit as true uprisings for the welfare of mankind. The directional norm has to manage the affairs of the country in such folds that new forces in public are always on anvil for gains from the industrial outfit. The growth is inclusive in attributes is to be ensured by proper channeling of the monetary resources of the government. Directional norms of the economy should be to improve upon the state of affairs in the country which will bring in new forefronts of development thus industrial processes could be supported in the country.

The state of affairs should be proper channeling of the monetary resources such that all trades are benefitted from the industrial processes and no ugly outlook of the industrial processes is based with the public. It so transcends that heavy industry seems to dominate the entire industrial processes and small scale industry or less tech-savvy industry vanquishes from the scene. An approach to equality in monetary folds should be embarked amidst public. Government should embark on development by maintaining recourses in discreet attires in industrial establishments. One industrial setup managed by one person is better administered rather than multiple industrial setups managed by one person. Government should divest the fruits of industrial processes in education, health and food subsidy to the poor such that there is uniform approach towards workouts of the government. The welfare state policy can then manifest into true form.

Improvisation of the markets should be undertaken such that quality products are sold under quality environment which will enhance the sale as a constant prospect. Tech-savvy products require proper quality servicing system to suffice the needs of the public therefore quality environment should be undertaken to support modern concepts of business and henceforth the clause of new understanding of business scenario is easily percolated amidst people. Improvisation of markets should be done such that markets remain competitive in their approach and maintains proper quality to withstand new standards in business scenario. Improvisation of markets should be done to be able to use the technical terminology in the modern world.

Imperfect markets in a developing nation can damage the prospects of growth therefore market terminology should be kept away from political climate but technical terminology should be used in the markets. Developing nations are highly oriented towards politics such that the growth prospects are highly in clause with politics and henceforth the business scenario is largely a representation of the political system which is erroneous. Political economy has the tendency to

dominate without recourse to judicious approaches in trade such that fruits of business are meager in terms. Henceforth no due acceptance is given to the product manufacturer. Technical terminology if used than quality of system improves otherwise political terminology produces so many bottlenecks in the path of industrial processes that sluggish prospects are seen in the business process.

High population growth in itself is a great hazard for the developing nations. Population explosion can damage the prospects of growth to extreme ends. The welfare state norms of development are run into oblivion because the welfare of the masses cannot be sought on large scale thus they are made to thrive on subsistence level of living. The population explosion is erroneous in that it is difficult to maintain recourse to judicious approaches to development. The population explosion is a great impediment in the path of establishment of industrial outfits as the monetary resources get consumed by the large population in the way of establishment of the industry. Industrial process henceforth should maintain recourse to new ventures by inspection of potentiality of the viable processes.

Modes of production should be changed to improve upon the quality of products and accommodate new employees. The modes of production should be changed but they should extend to large timescales such that the industrial process locates the extremity of the potentiality or full potential of the utility of the modern process in the public domain. The modes of production should not be changed drastically so that there is active pace of development otherwise economy faces stagnation. The modes of production in developing nation should be changed but not in short span of time as the evil of high population menace will curtail the gains to short terms with limited success. The industrial processes in populated livings demands longer durations of timeframes for their complete manifestations in market domains as the work aptitudes are of lethargic folds.

Grounds of industrial processes should be based on truth and welfare for the masses. Politics based on truth will enhance service quality of the system while technology for the welfare of the mankind will associate prosperous folds for the public.
