

## CHAPTER – 43

### WELFARE NORM AND INSTRUMENTS OF PROGRESS

The process of development as of is realized in the potential of the population. Theories are generated to deal with the reality of perspectives governing the folds of the working fields for development. The economic field as such is realized by various parameters which govern the folds of development in true posture and to the correct aptitudes which are part of the populations. Similarly the field of politics has into its fold various theories which rightfully characterize the potential of the populations in the process of linking to various developmental fields. The society as such is ruled by various natures of scientific temperaments which rightfully diagnose the problems of the masses and provides an amicable solution to all problems. The scientific theories of medicine and technical fields are all but apt to the problems of the masses and rightfully characterize the problems of the population. The theories of all of the fields of work are engrossed in a working culture which rightfully characterizes the nature of trades and aptly bounds the natural limitations of the characterization by the society of their fields of work. The nature of a field of work is intrinsic to the nature of the populations and is least apt for modifications. The process of development yields itself as a potential force for uplifting the masses from the vagaries in life and these vagaries in life are next required for correction by yielding itself to other strata of populations by in clause nature of progressive channelization. The forefronts of progressive development are thus required for as of casting itself into a potential force which can suit the purpose of development as a dynamic prospect. The degree of prospects which can be accrued for the citizens will be determined by the new instruments which we grade as of potential attribute in the nature of the welfare state policy. These instruments of progress will set the foundation of limits for policies under welfare state which can act as potential force for development. The realization of optimum interest rate system is aptly dealt for in the economic field as an essential component which is governing the dynamic folds of the development as of required for realizing the progress up to a correct degree in the society. The insurance sector is another dynamic instrument of progress which suits the needs of development under unfortunate events in the society which can damage the perspectives of the economy. The developmental folds in the insurance sector aptly serve the needs of the people under misfortunes and act as a barrier for negative growth. The dynamic folds of development are aptly required for adaptation to progression in the society and instruments of progress lead the way of progressive nature of trades to the desired levels which can harness the potential of the welfare state policy to an extreme end.

The dynamism of developmental policies under welfare state will become exposed only when the characterization is attributed into rationalities which can channel the course of development in true spirit and to the nature of the trade. The purposes in developmental forefronts are traced into the potentialities which are heavily dosed into the nature of the populations and as such provide a helping hand in the conduct of the policies under welfare state. The suitability of welfare state is measured by the standards which are heavily and profoundly engrossed in the nature of the populations. The in clause rule of attribution is to be traced into the extent up to which we can harness the potential of the trades such that we demarcate an open interface for all of the jargons in developmental forefronts and truly understand the functioning of the trades. The possibilities of development are traced in the potential of the populations only when we make a case for developmental folds by associating the true

potential of the people at every stage in the developmental course. The prospects of developmental course will be truly harnessed to the potentiality when the course of development is associated as serving the needs of the people and basing the prospects from development as a continuous association to the liking to all of the populations. The instruments of progress are but a channel in the course of development for an outlook which will truly demarcate the procedures of development an open interface by which we can ensure continuity in the developmental course. The underlying perpetuating principles for development are they need to be adaptable in such an outlook that they ensure continuity to the entire domain of developmental course. The principles are thus meant to be developed in such an outlook that we truly make a case for development by understanding the needs of the populations and at the same time harness the potential of the populations to demarcate favors by the welfare norm for the society. The principles are thus to be traced for the ongoing policies which will suit the requirements of the people and will associate the prospects on welfare state norm by the instruments of progress associating true favors for all of the populations.

The instruments of progress which we have stressed for developmental requirements need to be traced as an essential ingredient for defining true modes for the developmental course with high growth perspectives. The issue of progress is to be traced in the individual domain such that we can define the purposes in living to the personal liking and at the same time serve the needs of the people by associating favors to all. The instruments of progress are essential ingredients in such an aptitude that their functionality determines the course of development and determines the extent up to which the developmental course can be carried out. The purpose of instrument of progress is to be traced as a channel to add vigor to the processes of development such that their functionality will trace possibilities of development to the correct levels and to the true directions in the economic folds. The fundamental instruments of progress are to be traced in some of the forms as optimum interest rate system, insurance sector, utility services and those icons of progress which add vigor to the economic folds by guaranteeing continuous prospects for the economy. The understanding of the developmental forefronts in the present course of development can be identified in the instrument of progress which deals with quality of consoles being traded in the present world. This new instrument of progress which we define as quality terms for development inspects the potentiality of the processes by scrutiny as of if the development is being adaptable to the course of growth in the society. This new instrument of progress will scrutinize the modules of development if they make a case for continuous prospects in the society. The associations of this new instrument of progress is to be traced for if the developmental course guarantees safety to the works of developmental forefronts and if we are aptly surrendering our expertise to the causes in developmental forefronts in full potentiality. The processes of development are required to be certified in various domains of work culture before they can make an impact in the course of progress for the society. The highly technical course for development is suited for those countries which cause the course of growth by perpetuating technical perspectives. The world which is dependent on technology should harness the potential of the technical domain when they have aptly bounded the cause of growth in the nature of trade by ample expertise on technical means. As of in India the progressive folds need continuous corrections for the technical domain as large population cannot surrender their will to the technical domain.

The expeditious cause in the new instrument of progress is to be traced in the quality folds for development which is meant for locating the virtues in development intrinsic to the nature of populations and at the same time make a case for development by service to mankind by true modes in work outs. The open forefronts of developmental cause in this new instrument of progress lays

stress in the purpose which is associated as true modes for development. The virtues in development are meant to be discovered in the service to the mankind which is directly related with monetary supremacy for the people. The nature of trades thus should suffice the monetary perspectives for the populations. The associative clauses should open avenues for development which can be carried to long ranges and to long durations of times. The purpose of development thus should be located into the nature of populations. The computer as of today is the most virtuous element for progress in the present world. The adaptability of the computer in personal purposes is enormous and in due course of time it is going to be the main element of progress for all of the mankind. The nature of trades as of mended by the computers should harness the potential of the populations of the country. The in clause rule for supremacy as advocated by the computers should transcend the heart of the nation such that we associate the causes in development as of made for the populations of the country. The surety in purposes should be located in the computer domain and for this we need an instrument of progress which can truly set the limits for developmental folds. By far if we keep making use of the computers on the lines as workouts dictated by the western world we cannot guarantee safety of workouts in the national arena. The terminology for computers is to be set in national fervor such that computer domain make for most of the wishes of most of the populations. The stress is on computers for defining the purposes for development. The set terms in developmental forefronts are to make way for pragmatism by way of computers which should locate virtues in the natural instinct of mankind in the nation. The bifurcation of the terms in development is now to be traced in the terminology of quality governing the entire world. The populated world cannot make way for technical domain in easy terms while the world as a whole cannot replicate the dominance of the western terms. The quality term for development is required for exploration in the computer domain. The computer is a feasible component for quality and we need expertise to harness the potentialities of the national streams by explorations on the computer workouts.

The association of quality is to be traced in the local attributes of the nation. The world as such cannot replicate the same modes of development for all of the populations of the world. The regional factors which make way for progressive folds need to be associated for serving the needs of all of the populations. The association of quality becomes open for serving the needs of the populations to the greatest extent possible. The opportunism as located in the computer domain in the present world locates virtues for all of the populations on the same platform. The workouts in development are traced in the potential of the populations requires that we set the terms in development by making way for technology to adapt to our suitability and acknowledging the terms for development as of mending the folds for our requirements. The possibilities of continuous developmental forefronts are traced for in harnessing the talent of the nation to fruitful workouts which is possible only when the pragmatism of the developmental policies encourages the virtues in the nation to natural fervors which can make for virtues for all of the populations. The crux of the whole discussion is that we need to make way for quality in international terms such that we associate the advantages of the modern world to local or national forefronts. The perspectives of growth are associated to the maximum when the potential of the populations is located in the regional attributes which can enhance their performance and can pave way for progress on individual terms. An instrument of progress is needed which can define the developmental forefronts of the nation in quality terminology.

The governance in a country is limited to the local attributes and the governing folds try to optimize the performances in the various fields for benefits to all of the populations in the country.

The association of quality is to be seen as enhancing the performance of the populations by in clause economic uplifting of all of the populations. The quality terms in development demand that we try to optimize the performance of a particular field by continuous inputs as of improving the costing value of the product and services for gains to the populations. The dynamism in quality improvement techniques inherits a particular feature that it optimizes on the cost of the product and services in the economic run. An instrument of progress can be authorized to monitor the performance of the various fields of interest in the economic run. The processes yield in value and cost need to be monitored for by associating technical workouts for scrutiny by improvement in technical fields. The computers are adaptable to any kind of problem in any field and they try to optimize the performance of the fields by their ability to process enhanced aptitudes for excelling achievements. It will be the wholesome expertise of the computers which will make the transition to the new state feasible as of optimizing the performance in the long economic run. The computers are adaptable to technology and application of the computers in the field of expertise will make the performance of the fields very congenial for optimizing the performance of the product and services. An instrument of progress which optimizes the governing folds of the various fields of work can be authorized by setting standards at various stages in the long economic run. The standards of the fields would be set by inspection of the prevailing norms in the fields of work.

The invasion of foreign brands in the national forefronts may lead to uprooting of domestic markets and thus it is essential to compare the quality of the product with the quality of products which are produced in the nation. The association of quality thus should be dealt with in profitable terms for all of the products. Economic theories should be developed which can associate an advantageous prospect for the economic parameters in the country. A limiting value should be associated that only those people will be able to buy the foreign products those who can pay in terms of the currency of the foreign nation with which they trade the product. The availability of the foreign currency in the nation should in clause with developmental forefronts in the country which can bring foreign currency to the nation. The foreign currency brought to the nation should be used for purchasing of foreign goods. The possibilities of development in the international arena will lay the foundations of bringing the foreign currency to the nation by in clause rules as of extensions in the world trade needs mutual co-operation among nations for trade. The workouts of development will prove more prudent when the economic theories are able to reflect the potential of the developmental workouts to the nature of the populations such that we associate true justice for all of the populations. Brands of foreign countries are for those who value the foreign culture and work for the developmental forefronts at the international level. The domestic products are for those who can associate an advantageous prospect of the domestic industry. We can associate true justice for all of the people of the country if we make for economic theories which associate the nature of trades with the level of expertise encompassing the person. Very high expertise is for the foreign nationals while mediocre quality of workouts is for the national populations. As instrument of progress which restricts the entry of foreign products in the national stream is required such that we do justice to all of the populations in the world.

The computer technology in the form of internet has reduced the world to a single community. The ramifications of this internet technology are that it has made possible foreign brands to invade any country of the world. The enhanced view of foreign products leads to suppressing the will of the people to locate favors to the domestic products. These products project a depressing picture of the domestic industry and curtail the spirit of common people to work on lines which can

benefit most of the populations in the country. An enthusiastic picture of the domestic industry requires that economic theories restrict the invasion of foreign technology only to the extent it is feasible for the country. The feasibility of the foreign technology should be monitored for gains in the long run if the foreign technology will optimize the resources of the country by way of featuring in the country for long periods of times. Economic theories should reflect the potential of the domestic industry and at the same time should provide international exposure only to the extent it seems feasible for the national outlook. Quality terminology for technology so far has been raced in optimizing the performance of the product and services. The technology is running at a fast pace thus it is essential to locate favors to the domestic industry in the form of latest technology thus foreign dependence is but an essentiality. We need to optimize our performance at the international level. Quality thresholds should be prescribed for the national economy such that we make for most of the causes of the domestic industry by mass satisfaction to all of the populations. An instrument of progress should be authorized for curtailing foreign invasion in the domestic industry and limiting the utilization of foreign technology only to the feasible terms for development.

The transitional phases of welfare state policy norm has seen many of the instruments of progress enacted to serve the populations. The beginning of the welfare state saw insertion of utility services such as water supply to all houses, electrification to remotest places, communications channels such as telephones, telecommunications such as television etc. The purpose of these utility services was to provide the human mankind a raised platform of living such that they can seek higher understanding of the potential forces of living. The enactment saw these services manifesting as true developmental forces for all of the mankind. The purposes of these utility services saw enhanced trade in the nation and as such these potential forces of development made way for more instruments of progress which lead the way to safer and secure terms for livings while satisfying the demands of development in increasing measures. The welfare state now can be geared for more service to the mankind with the enactment of instruments of progress such as optimum interest rate system, insurance system, stock markets and many such enactments which enhance trade and virtues for livings. The sole purpose of instruments of progress is to provide a platform such that to suit the requirements for enhanced trade and lead the developmental forefront on virtuous grounds.

The new instruments of progress which we envisage in this workout as based on quality considerations is meant to be a mentor for enhanced trade in world localities. The purpose is to be traced in the effects the technological upbringing can cause to the nature of populations. The efforts are to be located for safe passage to technological upbringing such that we make for most of the wishes of the people in terms of technological workouts. The technology itself is virtuous only when it serves the basics of welfare state norm and quality considerations are but an effort to guide the thresholds of technological workouts to safe channeling into the public. The technology itself should be a soothing balm and should not be an obstruction for the wishes of the people thus we require a threshold by which we make technology a virtuous prospect. The purpose is located for service to the mankind in the long run is meant to be traced in the technological jargons and thus we should adopt technology only when it serves the purposes in high aptitude.
